Dear Josh,

Thank you very much for your letter and the diagram. I have deleted the reference to your unpublished work from the manuscript. Naturally, being acquainted with Kim's work, I do not believe that nuclear killing is the cause, or even a major cause of cell death. However, as you will see when you read my thesis, I have suggested that a good deal of nuclear killing is present after fairly high doses of U.V. in order to account for the presence of "zero-point" mutations in cells which I believe to be multinucleate.

I am enclosing a copy of my thesis, and will welcome your comments.

Sincerely,

*Peggy*
